EU General Data Protection Regulation

ARE YOU PREPARED FOR GDPR?

The EU General Data Protection Regulation (GDPR) is designed to harmonize data privacy laws across Europe, protect and empower all EU citizens' data privacy, and reshape the way organizations across the region (and the globe) approach data privacy. But, what does the GDPR mean to you and your organization? Are you prepared to demonstrate compliance with the GDPR's multitude of articles and provisions?

Let STEALTHbits help you achieve and prove compliance with critical components of the EU GDPR by:

1. Locating, classifying, and securing personal data covered under GDPR
2. Automatically implementing a least privilege access model
3. Enabling rapid response to breach scenarios
4. Automating the generation of compliance reports
5. Instituting effective, maintainable data security policies and measures

PERSONAL DATA

- Automatically discover where data exists across your network
- Examine the contents of 400+ file types (including images using OCR) stored within Network File Shares, SharePoint Sites, Cloud Storage platforms, and Exchange, as well as SQL databases
- Leverage over 350 preconfigured criteria sets aligning to general Personally Identifiable Information (PII), EU countries, and more
- Search across all files containing personal data to expedite Data Subject Access Request (DSAR) response when a user invokes their Right to be Forgotten
- Clean-up stale files that no longer need to be managed or maintained to reduce overall data scope and risk
- Classify (tag file metadata) and/or move, delete, modify permissions, and integrate with other technologies to automate manual processes

PRIVACY BY DESIGN

- Understand access rights, permissions, activity, data sensitivity, ownership, and file metadata across unstructured and structured data sources
- Automatically implement a least privilege access model, ensuring access rights and permissions are limited to only what users need at all times
- Govern access rights through integrated Entitlement Review and Self-Service Access facilities, or through integration with existing Identity & Access Management (IAM) technologies
- Monitor and secure Active Directory to prevent unauthorized access to data resources and mitigate risks associated with account compromise and privilege escalation
- Baseline security configuration and highlight high-risk conditions often exploited in breach scenarios across endpoints, Active Directory, and data repositories themselves

Collection → Access Restructuring → Continuous Certification
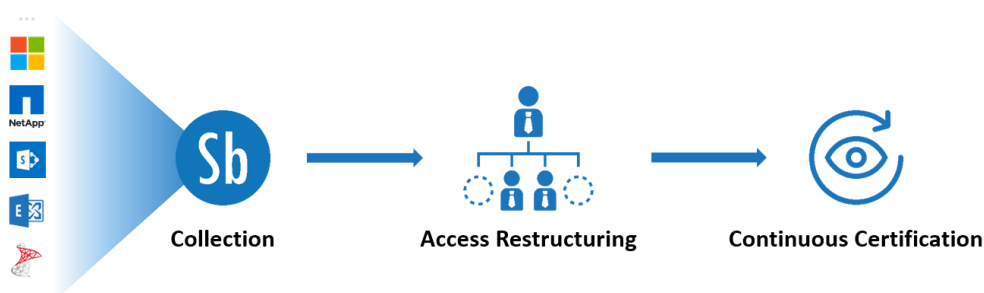

COMPLIANCE ON DEMAND

- Automate GDPR report generation, publication, and distribution
- Tag reports with classifications and designations for easy searching, while also controlling access via integrated Role-based Access Controls (RBAC)
- Maintain a full, searchable audit trail of all file access activities, Active Directory changes, account authentications, and more for forensic investigations and auditors

BREACH NOTIFICATION

- Detect and alert on abnormal behavior, suspicious activities, and attempts to compromise account or data security in real-time
- Integrate with existing SIEM solutions for consolidated alerting and advanced correlation with other network technologies
